

Domain Verification & Re-Verification

If you had enabled Nameserver verification (Verification Mode) and Re-verify Period under the Module's [Module Options](#) then you need to make sure the [Cronjob](#) is setup properly. Otherwise, any newly added domains will not get verified and existing domains will not be re-verified.

If the cronjob is calling the cron file (/modules/servers/dnsprovider/dnsprovider_cron.php) properly, then you should see a log in the WHMCS Module Logs (Utilities > Logs > Module Log) every time the cronjob is being run. You can also manually run the cron file in your browser by calling http://yourwhmcsurl/modules/servers/dnsprovider/dnsprovider_cron.php

Conversely, you may disable the verification mode and disable re-verification (Set it to 0).
