

Remote Connector (for Masked Redirection)

The remote connector was introduced in version 1.1 to work with [Masked Redirection](#). To use the remote connector, you must include it in your [webtemplate.zip](#).

Before including the connector files, make sure to modify the \$hash variable inside the connector_settings.php file, this need to match the Masked Redirection Hash in the [Module Options](#).

Both connector_settings.php and connector.php are not encoded, you may customize any changes you need.
